

Air Bleed System for Workholding Fixtures

- Eliminates erratic fixture operation due to trapped air within the fixture quickly and easily
- Compressed air generates a venturi vacuum that removes all air and oil within the fixture. Then, the oil fill tank replenishes the fixture with clean oil.
- An incredible time saver for fixture builders, integrators and lean manufacturing machine shops!
- Also used to remove coolant and particulate contaminated oil prior to fixture storage
- Supports single acting and double acting circuits
